

BLOCK LEASE

Trusted deposits for student housing.

Neutral escrow for cross-border move-ins, subleases, remote bookings, and lease takeovers.

Cross-border ready

Neutral escrow

Built for subleases

Instead of wiring a deposit to a stranger, the renter funds an escrow agreement until release or refund conditions are clearly defined.

The wedge is intentionally narrow

Block Lease does not need to replace the housing marketplace.

It only needs to de-risk the moment when both sides decide

Trust layer

The risky transfer becomes a structured flow.

Move one step of the deal into neutral escrow, then release or refund based on the agreement outcome.

The Problem

**The pain is not discovery.
It is commitment.**

Student housing moves fast, across distance, and between people who often do not know each other well. The deposit becomes the most stressful and least reversible step. The market does not need another listing site. It needs a commitment layer.

Core insight

**Trust breaks before
keys change hands.**

For renters

Sending a deposit directly to an unfamiliar person feels like the most irreversible step, especially before arrival or an in-person viewing.

For landlords and sublessors

Holding a room for a remote or first-time renter feels risky without a credible commitment signal and a clear funding path.

Where Block Lease Wins First

Cross-border move-ins

Students may need to secure housing before they have local banking history, a U.S. account, or the ability to visit in person.

Student-to-student subleases

Semester and summer subleases often happen between peers who have never met, even though the room and timing are real.

Why this matters

The same product wedge solves several situations where housing demand is real, urgency is high, and direct payment feels unsafe.

Remote booking

A renter may commit from abroad or another city before seeing the room, making the deposit decision unusually exposed.

Lease takeovers

When one student replaces another mid-lease, a clear deposit path reduces confusion during a rushed

Strategic advantage

Block Lease can work alongside campus communities, student housing operators, and international student channels instead of competing with them for listings.

How It Works

Escrow flow

Renter
Creates and funds deposit

Block Lease escrow
Funds remain neutral

move-in co

issue or cancellation

Refund
Back to renter

Funds stay neutral until the agreement reaches a clear outcome.

01

Create agreement

Set the parties, property, deposit amount, and release conditions.

Landlord or sublessor

02

Hold the deposit

Keep funds in escrow instead of sending them directly to the other side too early.

03

Resolve the outcome

Agreement workspace

Open a single agreement to review parties, property, deposit amount, timeline, and payout status.

Business Model

Why users pay

Block Lease reduces deposit risk for renters while increasing payment confidence for landlords and sublessors.

Go-to-market shape

Start where trust friction is already obvious: student housing operators, sublease communities, and international student channels.

Transaction fee

Charge a small fee per escrow agreement once funds are placed into the protected flow.

Verification services

Offer school email checks, identity verification, and renter or landlord trust signals as premium services.

Partner distribution

Work with student housing operators, campus communities, and international student programs that already source demand.

Expansion path

Add dispute handling, payout tooling, and reputation signals as the product matures.

Infrastructure Roadmap

Why smart contracts later

Escrow is fundamentally a conditional transfer problem, which makes rule-based automation a natural long-term fit.

Why stablecoins

Deposits should preserve value and settle predictably, which makes a dollar-backed asset more usable than a volatile token.

Suggested roadmap

- 1 Launch the escrow workflow and prove the user story.
- 2 Standardize agreement states, release rules, and review operations.
- 3 Add stablecoin settlement on an EVM Layer 2 such as Base.
- 4 Expand into dispute automation, partner tooling, and policy controls. Use an EVM Layer 2 when it improves fees, speed, and consumer UX.

BLOCK LEASE

The trust layer for the most fragile dollar in student housing.

A safer commitment path for cross-border move-ins, subleases, and remote rentals.

One-line pitch

Instead of asking a student to send a deposit directly to a stranger, Block Lease puts the money into escrow until the outcome is clear.
